ELECTROLYTES

Whichever electrolyte you choose to use, make sure when you submerge the plates in your solution, that there is at least 1 inch of solution above the plates, so they are totally submerged.

For electrolytes, use ONLY ONE of the following:

- 1.# White distilled vinegar (fill tank to cover plates , no water, just vinegar)
- 2.# Any Type of water with baking Soda (4 to 6 table spoons)

KEEP YOUR SOLUTION CLEANER

You can also add denatured alcohol or ethyl alcohol to help keep your water more clear and it will also help to from changing the water often. Add 1 quart to every gallon of one of the solutions above. Basically, if you cover the plates inside the tanker with our solution, Add one 1 quart or 1 litre of alcohol.

CHANGING WATER/SOLUTION

We recommend that you change your water or solution about once every 10 days. As long as your solution is close to being clear, you don't have to change it. When it becomes unclear or dark, please refresh your solution with new water or vinegar.

REMEMBER

Remember to always protect your tanker with a 20 amp fuse!

Thank you.
